

AMENDMENTS TO THE SPECIFICATION:

Page 5, replace the paragraph beginning on line 23 and bridging pages 5 and 6 with the following amended paragraph:

--The signal emitted by the antennas is adapted to be received by an electronic card also called a badge 45 in what follows. When this badge enters the field of emission of the antennas, it receives the modulated signal emitted by the antennas and thus emits in its turn a coded signal. This new signal is typically an RF (radio frequency) signal of a frequency of 433 MHz. It is received by an RF antenna provided for this purpose and analyzed to identify whether the code emitted by the badge corresponds to the code necessary to permit access to the vehicle 2 and possibly also starting its motor.--
